# Journal of Mechatronics, Electrical Power, and Vehicular Technology

Volume 13, Issue 2, 2022

## AIM AND SCOPE

Journal of Mechatronics, Electrical Power, and Vehicular Technology (MEV) is an internationally peer-reviewed journal aims to provide authoritative global source of scientific information for researchers and engineers in academia, research institutions, government agencies, and industries. The Journal publishes original research papers, review articles and case studies focused on:

**Mechatronics:** including control system, robotic, CNC Machine, sensor, signal processing, electronics, actuator, and mechanical dynamics.

**Electrical Power:** including power generation, transmission system, new and renewable energy, turbine and generator design and analysis, grid system, and source assessment.

**Vehicular Technology:** including electric/hybrid vehicle design and analysis, vehicle on grid, fuel efficiency, and safety analysis.

MEV's vision is to become an international platform with high scientific contribution for the global community. MEV's mission is presenting important results of work, whether in the form of research, development, application, or design.

## IMPRINT

MEV is published by National Research and Innovation Agency (BRIN) - formerly Indonesian

Institutes of Sciences (LIPI).

ISSN print: 2087-3379

ISSN electronics: 2088-6985

Electronics edition is available at:  
<https://mev.lipi.go.id>

All published article are embedded with DOI number affiliated with Crossref DOI prefix 10.14203

## PUBLICATION FREQUENCY

MEV is managed to be issued twice in every year. The first issue should be in the mid of the year (July) and the second issue is at the end of the year (December).

## PEER REVIEW POLICY

MEV reviewing policies are:  
Every submitted paper will be reviewed by at least two peer-reviewers.

Reviewers are unaware of the identity of the authors, and authors are also unaware of the identity of reviewers (double blind review method).

Reviewing process will consider novelty, objectivity, method, scientific impact, conclusion, and references.

## ACCREDITATION

MEV is Sinta 1 accredited by Kementerian Pendidikan, Kebudayaan, Riset, dan Teknologi Republik Indonesia via National Journal Accreditation (ARJUNA) accreditation platform.

<https://sinta.kemdikbud.go.id/journals/profile/814>

## COPY EDITING AND PROOFREADING

Every article accepted by MEV Journal shall be an object to Grammarly® writing-enhancement program conducted by MEV Journal Editorial Board.

## REFERENCE MANAGEMENT

Every article submitted to MEV Journal shall use reference management software e.g. Endnote® or Mendeley.

## OPEN ACCESS POLICY

 MEV Journal provides immediate open access to its content on the principle that making research freely available to the public to supports a greater global exchange of knowledge.

## PROCESSING CHARGES

Every article submitted to MEV Journal will not have any Article Processing Charges. This includes submission, peer-reviewing, editing, publishing, maintaining and archiving, and allows immediate access to the full text versions of the articles.

## PLAGIARISM CHECK

Plagiarism screening will be conducted by MEV Editorial Board using Crossref Similarity Check™ powered by iThenticate®.

## CROSSMARK

Every article will be published along with Crossmark button in the PDF and in the online abstract page. Crossmark gives readers quick and easy access to the current status of a piece of content.

## CITED-BY

Published article will be equipped with Crossref Cited-by service. Cited-by lets publishers show authors and readers what other Crossref content is citing their content.

## INDEXING & ABSTRACTING

MEV has been covered by these following indexing services:

EBSCOhost, Google Scholar, Directory of Open Access Journal (DOAJ), Science and Technology Index (SINTA), Crossref, Indonesian Scientific Journal Database (ISJD), Indonesian Publication Index (IPI), CiteULike, Cite Factor, Academic Journal Database, ResearchBib, Bielefeld Academic Search Engine (BASE), WorldCat, Sherpa Romeo, Index Copernicus, Open Academic Journal Index (OAJI), Open Access Articles, ROAD: the Directory of Open Access Scholarly Resources, Toronto Public Library, Western Theological Seminary, Ghent University Library, and Electronic Journals Library.

Currently, MEV has been completed CSAB review and accepted for Scopus inclusion

Volume 13, Issue 2, 2022

## FOREWORD FROM EDITOR-IN-CHIEF

Welcome to the latest issue in 2022 of the Journal of Mechatronics, Electrical Power, and Vehicular Technology (MEV), a peer-reviewed and broad-scope international journal. This issue consists of ten papers written by authors from different countries, such as Australia, China, India, Indonesia, Japan, Malaysia, Philippines, Taiwan, United Kingdom, and Vietnam.

We are pleased in this issue to present a diverse range of articles and papers that cover a wide range of topics within the field of Mechatronics, Electrical Power, and Vehicular Technology. One of the standout contributions in this issue is a paper by Rupesh and Tegampure on the DNN control technique in the photovoltaic system. This research has the potential to significantly impact the way we approach treatment in this area, and we are thrilled to have the opportunity to share this work with our readers.

We are also pleased to feature an article by Ramadiansyah et al. on the numerical investigation of the effect of ocean depth variations on the manipulator joint torque. This work provides development a mathematical model of a ship mounted two-DoF manipulator considering the ship dynamics and characterization of the ship motions.

In addition to these articles, we have several other papers that cover a wide range of topics, including an overview of early termination of PV-DG microgrid system, a method to find pump performance specifications when using a pump with a mixed flow type as a turbine for micro hydro power plants, investigation the impact of lightning masts placement on underground cables within high voltage substations, examination the strength of the universal joint after it was loaded with torsion, long-term forecasting for growth of electricity load based on customer sectors, optimization take-off position control of the bicopter model by investigating LQR cost matrices variation in actual experiments, plumbing leakage detection system with water level detector controlled by programmable logic controller, and a novel solution to deal with the complicated electronic circuitry for speed controller and too complex mechanical design of rotating mechanism of an orbital shaker.

We hope that you will find this issue to be a valuable resource, and we look forward to continuing to bring you the latest research and insights in the field of Mechatronics, Electrical Power, and Vehicular Technology.

Experimental studies of linear quadratic regulator (LQR) cost matrices weighting to control an accurate take-off position of bicopter unmanned aerial vehicles (UAVs)

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 101-112, 17 ill, 5 tab, 27 ref.

Controller design for airplane flight control is challenged to achieve an optimum result, particularly for safety purposes. The experiment evaluated the linear quadratic regulator (LQR) method to research the optimal gain of proportional-integral-derivative (PID) to hover accurately the bicopter model by minimizing error. The 3 degree of freedom (DOF) helicopter facility is a suitable bicopter experimental simulator to test its complex multiple input multiple output (MIMO) flight control model to respond to the challenge of multipurpose drone control strategies. The art of LQR setting is how to search for appropriate cost matrices scaling to optimize results. This study aims to accurately optimize take-off position control of the bicopter model by investigating LQR cost matrices variation in actual experiments. From the experimental results of weighted matrix variation on the bicopter simulator, the proposed LQR method has been successfully applied to achieve asymptotic stability of roll angle, although it yielded a significant overshoot. Moreover, the overshoot errors had good linearity to weighting variation. Despite that, the implementation of cost matrices is limited in the real bicopter experiment, and there are appropriate values for achieving an optimal accuracy. Moreover, the unstable step response of the controlled angle occurred because of excessive weighting.

Numerical investigation of the effect of ocean depth variations on the dynamics of a ship mounted two-DoF manipulator system

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 113-124, 10 ill, 7 tab, 32 ref.

The dynamics of a ship need to be considered in the development of a manipulator system that will be applied to the ocean-based operation. This paper aims to investigate the effect of ocean depth variations on the ship motion as disturbances to a ship-mounted two-DoF (Degrees of Freedom) manipulator joint torque using an inverse dynamics model. Realization is conducted by deriving the mathematical model of a two-DoF manipulator system subject to six-DoF ship motion, which is derived by using Lagrange-Euler method. It is then combined with numerical hydrodynamic simulation to obtain the ship motions under ocean depth variations, such as shallow (50 m), intermediate (750 m), and deep (3,000 m) waters. Finding results show that randomness of the ship motions appears on the manipulator joint torque. In the azimuth link, maximum joint torque is found in shallow water depth with an increment of 8.271 N.m (285.69 %) from the undisturbed manipulator. Meanwhile, the maximum joint torque of the elevation link is found in intermediate water depth with an increment of 53.321 N.m (6.63 %). However, the difference between depth variations is relatively small. This result can be used as a baseline for sizing the electrical motor and developing the robust control system for the manipulator that is mounted on the ship by considering all ocean depth conditions.

Numerical and experimental study of mixed flow pump as turbine for remote rural micro hydro power plant application

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 125-136 15 ill, 11 tab, 26 ref.

The use of a pump as opposed to a turbine/pump as turbine (PAT) for off-grid electrification applications is one of the important ways to be considered in efforts to equalize electrical energy in Indonesia. The main problem in PAT applications is how to predict pump performance if applied as a turbine to find out its best characteristics and efficiency points. This study discusses a method to find pump performance specifications when using a pump with a mixed flow type as a turbine for micro hydro power plants. The numerical method by utilizing computational fluid dynamics (CFD) based software simulations that have been proven to be accurate according to previous studies was selected for use in obtaining predictions of the pump characteristics as turbines. Then the PAT characteristics of the CFD simulation results are validated by conducting direct testing. The results of the CFD numerical simulation using ANSYS Fluent software show the performance curve of a mixed flow pump operated as a turbine at various rotating speeds. The highest efficiency for each rotating speed ranges from 35-40 %. The test results directly show the PAT characteristics, that the performance range is close to the numerical simulation results with a difference of 10 %.

(Author)

Keywords: pump as turbine (PAT); micro hydro power plant; computational fluid dynamics (CFD).

Sri Hartanto <sup>a</sup>, Desmayadi <sup>b</sup> (<sup>a</sup> Teknik Elektro, Universitas Krisnadwipayana, Indonesia; <sup>b</sup> Nissinbou Industries, Inc, Japan)

Plumbing leakage detection system with water level detector controlled by programmable logic controller type Omron CPM2A

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 137-146, 10 ill, 5 tab, 26 ref.

There is a chance of leakage in the plumbing caused by water pressure in the pipes, improper installation of pipe connections, or external influences, such as earthquakes. Plumbing leakage that is detected too late can cause damage to other systems. It is necessary to have a plumbing leakage detection system to detect a leak in the plumbing. Therefore, in this research, a plumbing leakage detection system is designed with a water level detector (WLD) controlled by a programmable logic controller (PLC) type Omron CPM2A. The method used in this research is designing the optimal model form of the system, which is distinguished by designing hardware and software, testing the devices, such as power supply, WLD, and channel relay module (CRM), and making conclusions. From the results of this research, it was found that the system works well in detecting leakage of plumbing, as indicated by all transistors' ability to work well where the electrodes (E1 and E2) are connected by water. The transistor in the WLD module will work as a switch or transistor in the saturation position. In this research, it can be seen that even though there is a leakage from the relay contacts of 1.8 VDC, it is still considered in a safe condition because to provide a trigger to the 3B3D Module, a minimum of 12 VDC is

required. In addition, when the relay is not working or off, the measurement at the normally closed (NC) terminal is 12 VDC.

(Author)

Keywords: channel relay module (CRM); leakage detection; programmable logic controller (PLC); water level detector (WLD).

Edwin Romeroso Arboleda (Department of Computer and Electronics Engineering, Cavite State University, Philippines)

Design, construction, and evaluation of transformer-based orbital shaker for coffee micropropagation

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 147-156, 23 ill, 2 tab, 25 ref.

This study offers a novel solution to deal with the complicated electronic circuitry for speed controller and too complex mechanical design of rotating mechanism of an orbital shaker. The developed prototype used a transformer that varies the supply voltage to control the speed of rotation of the orbital shaker. The prototype has five speed levels which depend on the input voltage. These speeds are 180 rpm at 12 V, 258 rpm at 15 V, 360 rpm at 18 V, 427 rpm at 21 V, and 470 rpm at 24 V. The prototype was tested to run continuously for 48 hours for each speed level, with speed being measured every hour using a tachometer. Statistical computation shows that the speed remains constant for the entire 48 hour period. Evaluation of results shows that the speed controller and the novel mechanical design for the orbital shaking motion achieved their functions. For this reason, it can be concluded that the prototype is durable and safe for use in orbital shaking applications.

(Author)

Keywords: DC motor; orbital shaker; rotating mechanism; speed controller; step-down transformer.

Mailugundla Rupesh <sup>a</sup>, Vishwanath Shivalingappa Tegampure <sup>b</sup> (<sup>a</sup> Department of Electrical & Electronics Engineering, India; <sup>b</sup> Department of Electronics & Communication Engineering, India)

Cascade feedforward neural network and deep neural network controller on photovoltaic system with cascaded multilevel inverters: Comparison on standalone and grid integrated system

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 157-178, 31 ill, 2 tab, 21 ref.

The introduction of a micro-grid-based power generation network will help to meet the demands of consumers while reducing environmental impact. Several industrialized and emerging countries allocate considerable resources to renewable energy-based power generation and invest significant sums of money in this area. This study examines the challenges involved with electricity generation through photovoltaic (PV) systems and the integration of the same with the grid to mitigate power quality issues and improve the power factor for various loading conditions. An innovative multilayer inverter for grid-connected PV systems has been developed to enhance the voltage profile and resulted in a drop in total harmonic distortion (THD). A cascade multilevel inverter (associated with a grid-integrated PV system and managed using multiple innovative artificial intelligence controllers) was developed in this research project. Various advanced intelligent controllers, such as cascade feedforward neural networks

(CFNN) and deep neural networks (DNN), have been analyzed under various operating situations and observed that the THD of voltage, current at the grid, and the load is less than 3 % as per the IEEE 519 standards along with this power factor is maintained nearly unity for the grid-connected system. The quality of power in terms of voltage, frequency, total harmonics distortion, and power factor are improved by using a novel deep neural network algorithm in a cascaded multilevel inverter and verified according to IEEE 1547 and IEEE 519 standards to determine the efficacy of the proposed system.

(Author)

Keywords: cascaded feedforward neural network; deep neural network; multilevel inverter; photovoltaic system; total harmonics distortion.

Torsional strength analysis of universal joint 's ZP-11A due to yokes modification and materials

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 179-188, 15 ill, 8 tab, 20 ref.

The study examined the strength of the universal joint after it was loaded with torsion. It used different materials that can withstand tensile stress in accordance with accepted principles and made modifications to the yoke as a result of the topology optimization process. The topology optimization determined that the yoke's part needed to withstand load without changing its dimensions and minimize stress distribution. According to the results, the maximum shear stress on the spider of the original universal joint model made of JIS-SF590A steel was 84.57 MPa, the shear stress on the yoke component was 30.84 MPa, and the maximum von Mises was 341.1 MPa. As a result of using JIS-SF590A steel, yoke modification 3 has produced a reduction in shear stress of 12.97 % and a reduction in von Mises stress of 35.33 % from the original yoke. This is the most efficient design of yoke and also this modified yoke form provides a wider elevation angle and is easier to manufacture.

(Author)

Keywords: shear stress; topology optimization; universal joint; von mises.

Mostafa Nazih (Future Energy, GHD Pty Ltd, Australia)

Effect of lightning mast placement on underground power cable jacket stress within high voltage substations

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 189-200, 17 ill, 1 tab, 30 ref.

This study aims to investigate the impact of lightning masts placement on underground cables within high voltage substations. While the subject of lightning discharges near to underground cables has been covered with open cable runs and wind farms in many papers, this study focuses on lightning events within high voltage substations considering the associated effective zones, which were not covered in the available literature. Substations built within areas prone to high lightning activity experience frequent discharges that cause the potential rise of the earthing system into hundreds of kilovolts. The potentials propagating within the soil and the earthing grid affect underground cables jackets terminated within the

substation. The numerical analysis of the problem is carried out using Current Distribution, Electromagnetic fields, Grounding and Soil structure analysis (CDEGS) software engine for different configurations of lightning mast placements with varied separation, electrode placement and length, soil resistivity, and lightning current. Study findings indicate that provision of lightning masts/down conductors as far as possible or at least twice the effective zone radius from cable termination/route electrodes ensures relatively lower stress voltages. Electrodes with effective zone radius length placed as close as possible to lightning masts further reduce the attainable jacket stress voltages.

Component degradation and system deterioration: an overview of early termination of PV-DG microgrid system

Journal of Mechatronics, Electrical Power, and Vehicular Technology, 2022, vol. 13, no. 2, p. 201-213, 9 ill, 3 tab, 100 ref.

Degradation of components and system failure within the microgrid system is deteriorating the performance of electrification. The aim of this study is to discuss the relationship and connections between issues resulting from degradation and deterioration in the microgrid system, in addition to introducing the prominent impacts which may eventually lead to the premature termination of the microgrid system. This study explored the microgrid degradation and deterioration issues within four microgrid sections: generation section, storage section, transmission section, and distribution section. Subsequently, this study analyzes, derives, and classifies all emerging issues into four types of prominent impacts. The degradation and deterioration invoked many component performance issues into four main damaging outcomes, namely (i) deteriorated transmission line yielded issues regarding expected energy not achieved; (ii) energy deficit and unpredicted blackout come after the depth of discharge (DOD) reduction and invoke a loss of power supply; (iii) a shorter battery life cycle, shorter transformer lifespan, and decreased DG lifetime concluded as a shorter microgrid life expectancy; and (iv) rapid microgrid broke down and the crash of the key component inadvertently fastened the time to failure and gave rise to the early failure of a microgrid system. It is envisaged that the discussion in this study can provide useful mapped information for the researcher, stakeholder, operator, and other parties for thoroughly addressing various degradation and deterioration issues and anticipating the early termination of the microgrid system.

Long-term forecasting for growth of electricity load based on customer sectors

*Journal of Mechatronics, Electrical Power, and Vehicular Technology*, 2022, vol. 13, no. 2, p. 214-221, 2 ill, 7 tab, 37 ref.

The availability of electrical energy is an important issue. Along with the growth of the human population, electrical energy also increases. This study addresses problems in the operation of the electric power system. One of the problems that occur is the power imbalance due to scale growth between demand and generation. Alternative countermeasures that can be done are to prepare for the possibility that will occur in the future or what we are familiar with forecasting. Forecasting using the multiple linear regression method with this research variable assumes the household sector, business, industry, and public sectors, and is considered by the influence of population, gross regional domestic product, and District Minimum Wage. In forecasting, it is necessary to evaluate the accuracy using mean absolute percentage error (MAPE). MAPE evaluation results show a value of 0.142 % in the household sector, 0.085 % in the business sector, 1.983 % in the industrial sector, and 0.131 % in the total customer sector.

## Abstract

There is a chance of leakage in the plumbing caused by water pressure in the pipes, improper installation of pipe connections, or external influences, such as earthquakes. Plumbing leakage that is detected too late can cause damage to other systems. It is necessary to have a plumbing leakage detection system to detect a leak in the plumbing. Therefore, in this research, a plumbing leakage detection system is designed with a water level detector (WLD) controlled by a programmable logic controller (PLC) type Omron CPM2A. The method used in this research is designing the optimal model form of the system, which is distinguished by designing hardware and software, testing the devices, such as power supply, WLD, and channel relay module (CRM), and making conclusions. From the results of this research, it was found that the system works well in detecting leakage of plumbing, as indicated by all transistors' ability to work well where the electrodes (E1 and E2) are connected by water. The transistor in the WLD module will work as a switch or transistor in the saturation position. In this research, it can be seen that even though there is a leakage from the relay contacts of 1.8 VDC, it is still considered in a safe condition because to provide a trigger to the 3B3D Module, a minimum of 12 VDC is required. In addition, when the relay is not working or off, the measurement at the normally closed (NC) terminal is 12 VDC.

Keywords: channel relay module (CRM); leakage detection; programmable logic controller (PLC); water level detector (WLD).

## I. Introduction

Plumbing leakage is a problem because whenever there is a leakage somewhere, it cannot be found at an early stage and can become a big problem, leading to water wastage [1]. The basic principle of leakage detection is the loss of pressure on one of the sensors at a fast rate. The use of the pressure transmitter sensor changes it from a sensor to a signal that can be decoded by the controller [2]. The liquid level (as in, e.g., water level) is the height associated with the liquid-free surface, especially when it is the topmost surface. It may be measured with a level sensor [3]. The water level control is a tool that can make it easier to identify the water

level in the water reservoir [4]. The automatic water level controller minimizes the need for manual switching and human interference. The machine helps to detect the level of water or any liquid [5]. Water flow sensors detect a different value during water leakage occurred [6]. The sensor module collects the relevant data to decide whether the applications to be monitored are working effectively under certain threshold values [7].

The water leakage detection system can be deployed in the already existing plumbing with flow rate sensors attached to the path of the water flow [8]. Constant leakages through pipes in walls lead to water seepage, which may damage the structural components of the building [9]. The control of all equipment has been performed through the use of computers. Most equipment uses

\* Corresponding Author. Tel: +62-218462230; Fax: +62-218462231  
E-mail address: srihartanto@unkris.ac.id

programmable logic controller (PLC) to connect with computers to monitor each load and electricity-consuming devices [10].

The PLC constitutes one of the main architectures of manufacturing system control and is programmed with standardized languages [11]. By integrating motion control into the PLC, the control system was greatly simplified because simple motion control can be realized by the PLC without a special motion controller [12]. PLC is time-driven with time stamps defined by the input/output (I/O) scanning and does not receive/emit events but logic variables. Hence, the input and output events must be defined from combinations of variables [13].

PLC plays a significant role in automatic control systems. A ladder diagram is the most widely used programming language for PLC, which is transparent and intuitive since the variables are represented as graphical symbols and each instruction is graphical [14]. PLC projects commonly use five programming languages including two textual languages, i.e., structured text (ST) and instruction list (IL), and three graphical languages, i.e., function block diagram (FBD), ladder diagram (LD), and sequential function chart (SFC) [15]. PLC application program development is becoming crucial due to the growing complexity of control problems associated with the demand for high-quality solutions [16].

The sensor and actuator signal data are collected from the PLC memory through a single communication channel (as collecting data from the actual sensors and actuators is extremely costly); and only a fraction of those signals can be accessed at a given time [17]. The essential role of PLC is to interact with sensors and actuators [18]. PLCs are providing the bridge between the cyber and physical worlds by controlling devices such as valves, pumps,

and motors in response to operator input or their preprogrammed control logic [19]. Input-output specification of the PLC-based function block for considered control law has to be compatible with the specification of the presented "Identification Block" [20]. The goal of PLC data collection is to record both the input and output values whenever there is a change in any of the I/O values [21].

The ladder logic programming language requires the programmer to create diagrams of input and output relays to depict the order and circumstances in which connected devices are toggled and act [22]. Ladder logic is one of the most used programming languages to feed instructions into the PLC [23]. The PLC control logic process deals with the input signals before producing output to regulate the connection and disconnection of the liner circuit [24].

Therefore, in this research, a plumbing leakage detection system controlled by the PLC type Omron CPM2A was designed. In order to determine the location of leakage more precisely, it inserts the detector on the building's water line shaft or at a probable leak. This research is focused on measuring and analyzing the stability of the power supply and measuring the performance of the water level detector (WLD) in the plumbing leakage detection system controlled by the PLC type Omron CPM2A.

## II. Materials and Methods

The flowchart of this research methodology that describes the steps carried out in this research is shown in Figure 1. The steps carried out in this research are

- Design; distinguished by designing hardware, which includes making the design of the device to be made, determining the components and dimensions of the device to be made, and designing software, which includes making ladder diagrams on the CX Programmer which the PLC is then programmed with.
- Testing; measures the hardware and software that has been made.
- Analysis; analysing the tests carried out on the system with measurements of the power supply output, electronic circuits on the WLD, and the channel relay module (CRM).
- Conclusion; making a distinguish conclusion from research data that has been previously analysed.

### A. Designing the overall model system

A control unit usually consists of three steps: input, computing, and output, and each task is executed cyclically. In the input step, the control unit reads the values of the sensors. In the computing step, the control unit performs some computations such as numerical calculations and conditional judgment, etc. In the output steps, the control unit modifies the values of the variables that are mapped to some output points or control actuators to conduct certain mechanical actions by providing output signals to driver devices [25].

Figure 1. Research methodology flowchart

Controllers are generated for random systems with different values of the prediction horizon, the system delay, and the dimensions of the state, control input, and system output. The controller is programmed on the PLC [26].

The design of the plumbing leakage detection system controlled by the PLC type Omron CPM2A can be seen in Figure 2. In Figure 2, the designed system is divided into six parts, namely the input process using a WLD as a water level detector, which then activates the CRM as a direct bit information provider to the PLC type Omron CPM2A to be processed. The results of data processing are displayed by the Omron NB7-TW00B human-machine interface (HMI). In addition, the power supply serves to supply power to the system via the PLC type Omron CPM2A.

### B. Designing the water level detector

The WLD as shown in Figure 3 is made with electronic components including a single pole solid relay 12 VDC as a relay that will activate dry contact normally open (NO)/normally closed (NC), diode 1N4001/4002 as polarity reverse current protection in the relay coil, transistor BD441/D400 NPN as a function switching, resistors, and capacitors. The WLD will work when there is induction in positive and negative polarities. The voltage source used is 12 VDC.

Two copper rods will act as electrodes when immersed in water. The existence of a resistance value of the two copper rods causes the transistor to work to open the channel from the collector to the emitter and activate the 12 VDC relay coil. The dry contact of the relay is used to provide logic 1 as a trigger for the 3B3D Module.

The WLD as shown in Figure 4 requires a standby voltage of 12 VDC which is connected to the (+) and (-) terminals, the voltage polarity must match. At terminals E1 and E2, a cable connection is installed to the electrode stick/copper rod as a water level detector. At the NO terminal when the system is working or the WLD detects water, the terminal will issue 12 VDC which will be used as a trigger, and during normal standby, the NO standby terminal is at 0 VDC.

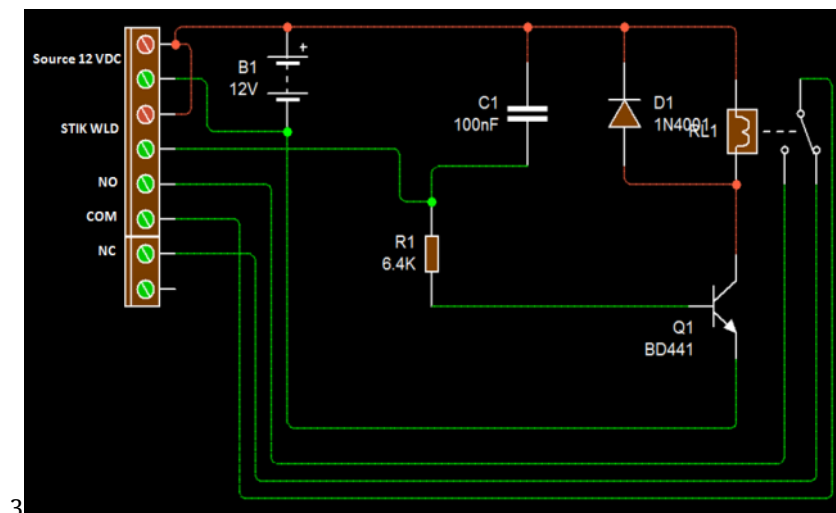

Figure 3. Electronic circuit of WLD

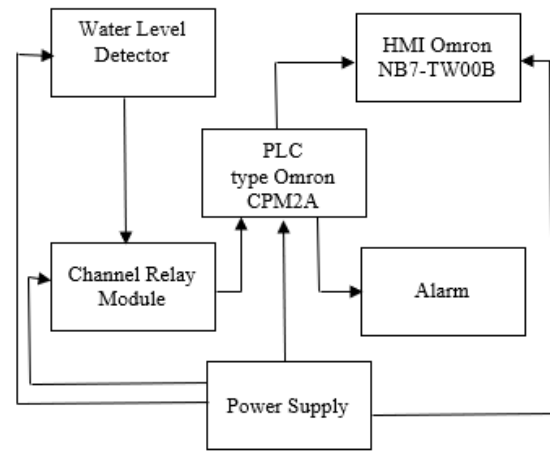

Figure 2. Block diagram of system design

In this research, 10 WLDs are placed on each floor, and the distance between each WLD is 2.5 meters. All WLDs on each floor work to detect water pipe leakage by detecting waterlogging on each floor.

### C. Designing the channel relay module

The circuit of CRM can be seen in Figure 5. In the CRM, there is a 3B3D Module as a digital timer that can be set from 0–999 minutes and there are 4 timer options, namely delay off, delay on, delay on and off, and consistent delays on and off. In designing the plumbing leakage detection system, the 3B3D Module is used to adjust the pulse signal. The COM terminal is the trigger input to activate this module, which is controlled by WLD as shown in Table 1.

### D. Designing PLC type Omron CPM2A as controller

PLC used in this system is PLC type Omron CPM2A which has the specifications shown in Table 2. The PLC requires a voltage source of 220 VAC, for the COM terminal and input it uses 24 VDC which comes from the PLC's internal voltage source.

The software used to create the Ladder Diagram is CX Programmer version 9.5 and the type of PLC selected when programming the CX Programmer is PLC type Omron CPM2A. In the ladder diagram of the input detector section as shown in Figure 6 and

Figure 4. Water level detector

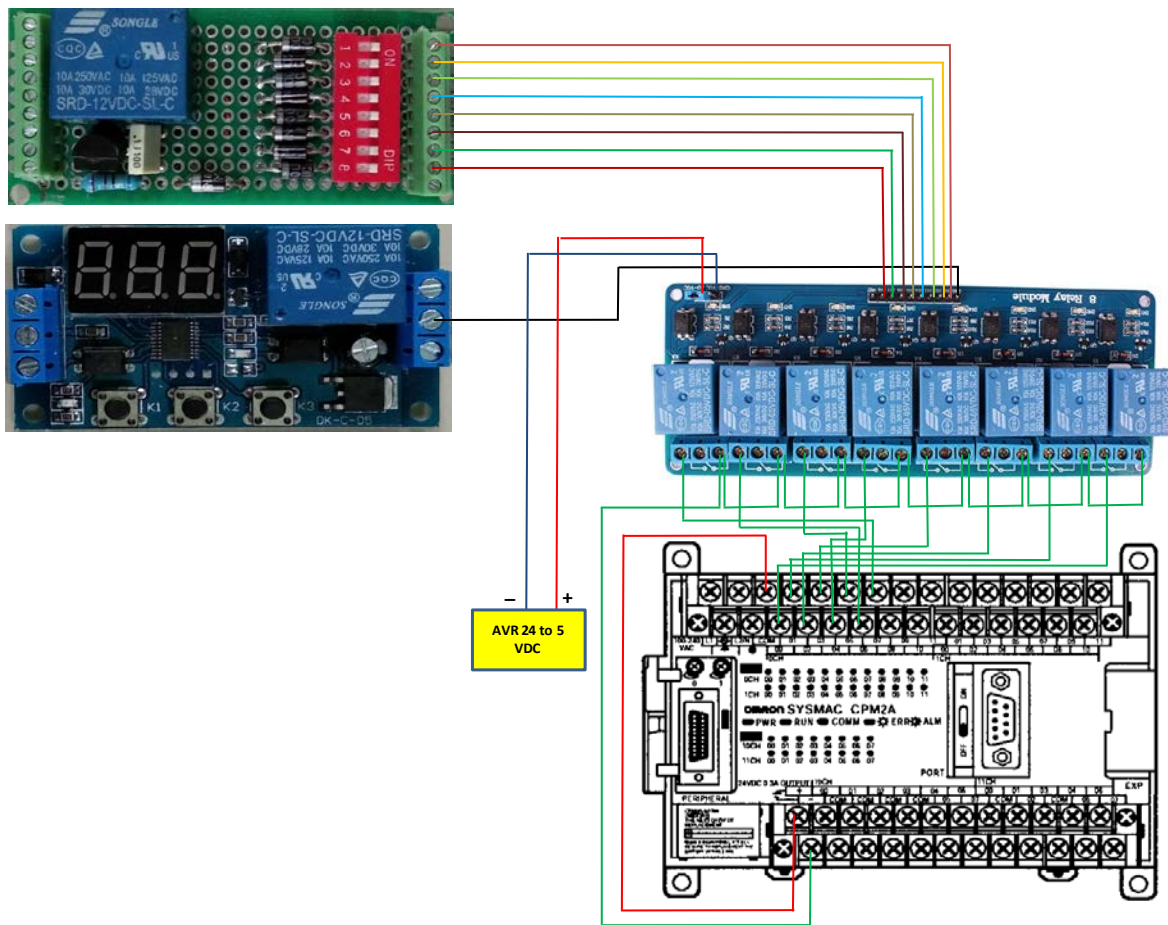

Figure 5. Channel relay module

Figure 7, the bit information that enters both logics 0 and 1 at addresses 0.00 to 0.07 is a binary value that will be converted to hexadecimal with the BCD (24) instruction on Data Memory 0 (DM0). Then the incoming bits for addresses 0.00 to 0.07 can be ascertained apart from binary with a value of 0, a value above 1 then logic 1 will activate LR9.04 which is used as a relay bit to activate the T0003 timer, where this timer functions as a time lag whether the WLD is in the area is a true alarm.

The ladder diagram was created as initials of data representing decimal constant values into initials in the Data Memory (DM), the instructions used is the

MOV instruction (21), the value used is #1 to #255 then initialized to DM1 to DM255 which also represents Detector 1 to Detector 255. The P\_On instruction is used because the command instructions in this initial data section must always be active or always on the flag as shown in Figure 8 and Figure 9.

To activate the alarm there is only one option, namely when the LR9.04 alarm occurs. On the bell LR9.04 when a logic 1 will activate the 10.00 output, which is the bell output, LR9.02 is used to activate LR9.03 which will activate T0001, i.e., the timer to pause the alarm time, thereby causing the alarm to

Table 1. CRM addressing

be deactivated. If T0001 is reactivated then the 10.00 outputs will be active again or the bell will ring. When the alarm is in progress and the bell is deactivated, if a new alarm is entered, the bell can be reactivated because LR9.04 is the main input. For

Table 2. Specification of PLC type Omron CPM2A

Specification	Number

Power	100-240 VAC

strobe LR9.04 will activate output 10.01 which is the strobe output address on the PLC, output 10.01 will be off if input 1.01 is a logic reset address 1. During the alarm, the strobe will remain active can be seen in Figure 10.

### III. Results and Discussions

Testing the device is carried out to determine the performance of each component used. This test is expected to get good results where all components of the plumbing leakage detection system work.

When the start button (channel 1.00) is pressed on the main menu on the HMI screen, the system is completely disabled in monitoring status. While a waterlogging on one floor has crossed the water level limit of 30 mm, the detection rod connected to the water causes a resistance value in the WLD circuit which then puts the transistor in the

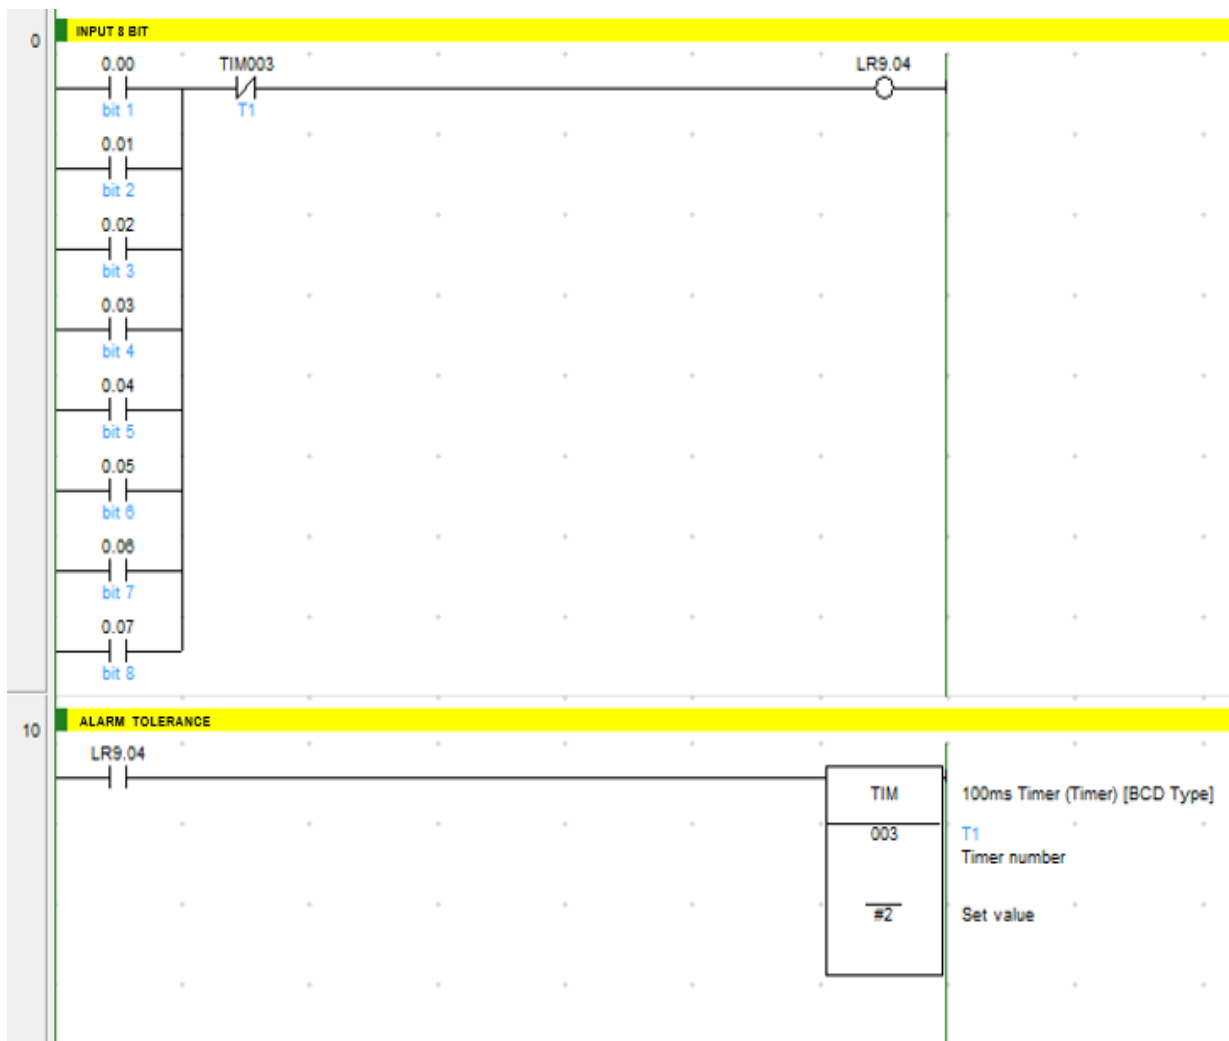

Figure 6. Ladder diagram 1 of detector input

Figure 7. Ladder diagram 2 of detector input

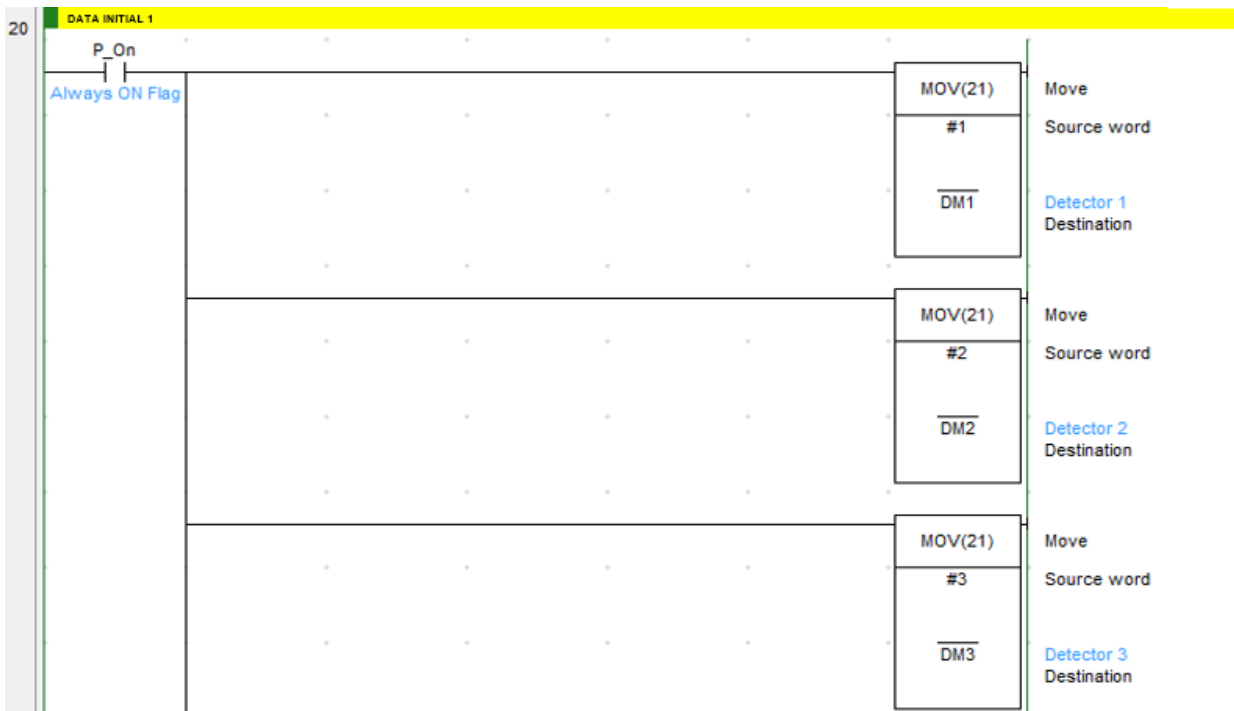

Figure 8. Ladder diagram 1 of initial data

saturation position. This causes the current from the collector of the transistor to flow to the emitter so that the relay coil gets a voltage of 12 VDC and the relay works. Furthermore, the NO terminal on the WLD gives an output of +12 VDC so that it triggers the CRM. The design of this plumbing leakage detection system uses 10 WLDs with addresses 1 to 10.

Active relays on the CRM will send bits to the PLC input group, namely addresses 0.00 to 0.07 (8 bits). The 8-bit signal from the sensor circuit to the PLC is

initialized with DM0 and will be compared with DM1 to DM255 which is the initial decimal address 1 to 255. If DM0 is the same as data memory 1 to 255 then the alarm will be active on the screen monitoring status of the WLD with the output address used for alarm status is IR20.00 to IR35.14. The new alarm will still be displayed on the HMI screen, even though the alarm on the other WLD is still in alarm status. While the alarm is active, the PLC activates the bell output (10.00) and strobe (10.01).

A. Power supply measurement

When a 220 VAC power supply which is the main power source is supplied to the system by activating a single-phase miniature circuit breaker (MCB) which supplies a 220 VAC voltage source to the

power supply, the system works normally. By measuring three types of power supplies that have three types of power supplies, 12 VDC, 24 VDC, and 5 VDC which makes the PLC ON and connected to the CRM.

Figure 9. Ladder diagram 2 of initial data

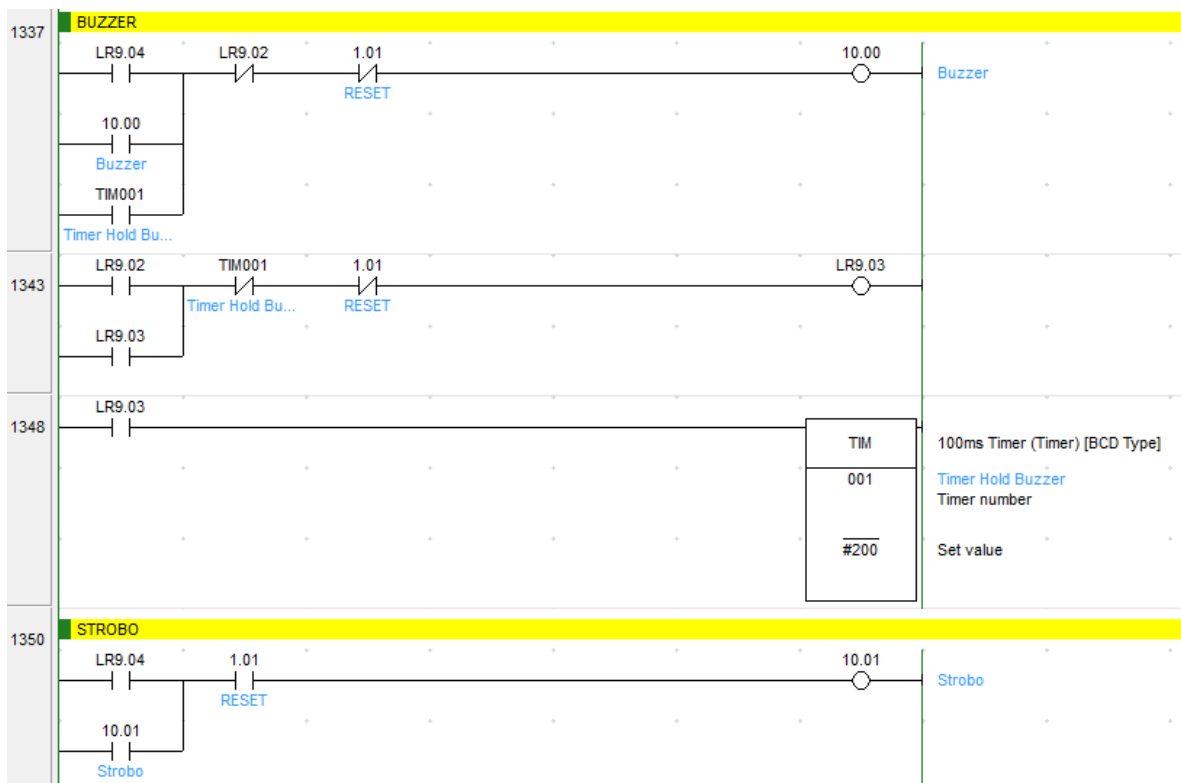

Figure 10. Ladder diagram of alarm

Table 3.  
Measurement results of power supply voltage performance

Measurement	$V_{input}$ (V)	$V_{output}$ (V)		Function
		No-load (OFF)	Under load (ON)	
Melan Well LRS-75-24	220	24.2	24	HMI, AVR
Yamasaki	220	12.1	11.8	WLD
ETA-SEI SVM05SC24	24	5.2	5	CRM

In the initial observations, all components after the 220 VAC power supply provided could work well or normally. Measurement of the voltage issued by the power supply is carried out when the system is working (ON) and not working (OFF).

From the results of the power supply measurements in Table 3, it can be analyzed that the output voltage when there is a load (the system is working) decreases by 0.15 to 0.2 VDC when compared to the output voltage when there is no load (the system is not working). This decrease is still within the safe tolerance value of the supply voltage of the components. All power supplies work well because the measurement results in no-load values of 24.2 VDC, 12.1 VDC, and 5 VDC which indicate the output voltage according to the specifications of the power supply.

#### B. Water level detector measurement

From Table 4, the results of the transistor work measurements can be analyzed. When the electrodes (E1 and E2) are connected by water, the transistor in the WLD module will work as a switch or transistor in saturation position. At saturation, the average collector current ( $I_c$ ) is 1.73 mA and the base current ( $I_b$ ) is 117.8 mA while the  $V_{ce}$  voltage is 205 mV. In this position, the relay on the WLD will work because the relay coil gets a voltage of 12 VDC. When E1 and E2 is disconnected or not connected, the transistor will be cutoff, i.e., the transistor acts as

a switch in the open position. In the cutoff position, it can be seen that  $V_{ce}$  has a value of 12 VDC,  $I_c$  has a value of 0 mA and  $I_b$  has a value of 0 mA. In this position, the relay in the WLD will be off because the relay coil does not get a voltage or 0 VDC.

All transistors can work well because from the measurement results obtained values when saturation  $V_{ce}$  has a value of 0.203 to 0.207 VDC,  $I_c$  has a value of 116 to 118 mA, and  $I_b$  has a value of 1.73 mA and when cut off  $V_{ce}$  has a value of 12 VDC,  $I_c$  has a value of 0 mA, and  $I_b$  has a value of 0 mA which shows the transistor is working properly.

From the measurement results of the CRM in Table 5, it can be analyzed that the relay coil measures 11.8 to 12 VDC. When the relay does not work, the measurement of the relay coil results in 0 VDC, and the breakdown voltage at the NO terminal which should be in the open position is 1.8 VDC.

Even though there is a leakage from the relay contacts of 1.8 VDC, it is still considered in a safe condition because to provide a trigger to the 3B3D Module with a minimum of 12 VDC. When the relay is not working or off, the measurement at the NC terminal is 12 VDC.

All relays on the CRM are functioning well because from the measurement results, the coil input value is 11.8 to 12 VDC and when the coil does not get a voltage input, the relay will turn off which indicates it is in accordance with the relay specifications.

Table 4.  
Measurement results of transistor performance in WLD circuit

	OFF	0	1.8	12
10	ON	11.8	12	1.8
	OFF	0	1.8	12

## IV. Conclusion

This research resulted in the conclusion that all power supplies work well because the measurement results in no-load values of 24.2 VDC, 12.1 VDC, and 5 VDC which indicate the output voltage according to the specifications of the power supply; all transistors can work well because from the measurement results obtained values when saturation  $V_{cc}$  has a value of 0.203 to 0.207 VDC,  $I_c$  has a value of 116 to 118 mA, and  $I_b$  has a value of 1.73 mA and when cut off  $V_{cc}$  has a value of 12 VDC,  $I_c$  has a value of 0 mA, and  $I_b$  has a value of 0 mA which shows the transistor is working properly, and all relays on the CRM are functioning well because from the measurement results, the coil input value is 11.8 to 12 VDC and when the coil does not get a voltage input, the relay will turn off which indicates it is in accordance with the relay specifications. In this research, it can be seen that even though there is a leakage from the relay contacts of 1.8 VDC, it is still considered in a safe condition because to provide a trigger to the 3B3D Module, a minimum of 12 VDC is required. In addition, when the relay is not working or off, the measurement at the NC terminal is 12 VDC.

Volume 13, 2022

## AUTHORS INDEX

The articles in this volume were authored/co-authored by 76 authors from Indonesia, Taiwan, Malaysia, Australia, Germany, South Korea, United Kingdom, Vietnam, Turkey, Thailand, Japan, Philippines, India, and China.

- Abdullah Iskandar Syah, "Long-term forecasting for growth of electricity load based on customer sectors," 13(2):214-221
- Aditya Sukma Nugraha, "Numerical and experimental study of mixed flow pump as turbine for remote rural micro hydro power plant application," 13(2):125-136
- Afaf Fadhil Rifa'i, "Pattern recognition based movement control and gripping forces control system on arm robot model using LabVIEW," 13(1):1-14
- Agung Surya Wibowo, "Design and application of models reference adaptive control (MRAC) on ball and beam," 13(1):15-23
- Ahmad Fudholi, "Component degradation and system deterioration: An overview of early termination of PV-DG microgrid system," 13(2):201-213
- Ahmad Rajani, "Component degradation and system deterioration: An overview of early termination of PV-DG microgrid system," 13(2):201-213
- Aken Derisman, "Study on the production of hydrogen gas from water electrolysis on motorcycle engine," 13(1):88-94
- Al Ichlas Imran, "Study on the production of hydrogen gas from water electrolysis on motorcycle engine," 13(1):88-94
- Aminuddin Debataraaja, "Carbon electrode sensitivity enhancement for lead detection using polypyrrole, ionic liquid, and nafion composite," 13(1):95-100
- Aminuddin Debataraaja, "Fabrication of nitrate ion sensor based on conductive polyaniline doped with nitrate using thick film technology," 13(1):72-78
- Andi Setiawan, "Torsional strength analysis of universal joint's ZP-11A due to yokes modification and materials," 13(2):179-188
- Bagus Made Arthaya, "Design and kinematic analysis of a two-DOF moving platform as a base for a car simulator," 13(1):48-59
- Bambang Riyanto Trilaksono, "Design and application of models reference adaptive control (MRAC) on ball and beam," 13(1):15-23
- Charlothha, "Fabrication of nitrate ion sensor based on conductive polyaniline doped with nitrate using thick film technology," 13(1):72-78
- Cheng Yee Ng, "Numerical investigation of the effect of ocean depth variations on the dynamics of a ship mounted two-DoF manipulator system," 13(2):113-124

# Journal of Mechatronics, Electrical Power, and Vehicular Technology

## *INTERNATIONAL PEER REVIEWERS ACKNOWLEDGEMENT*

The Editor of MEV would like to thank the wisdom and advice of many individuals who dedicated their considerable time and expertise in safeguarding the quality and high standard of academic integrity of the journal.

We are greatly indebted to the expertise, dedication, and expeditious response of the following individuals for reviewing at least one and, in some cases, many manuscripts for the journal from early 2010 until today.

Prof. Ir. Jamasri, Ph.D.  
Department of Mechanical and  
Industrial Engineering, Gadjah  
Mada University, INDONESIA

Dr. Ir. Iman K Reksowardojo  
Mechanical and Aerospace  
Engineering, Institut Teknologi  
Bandung, INDONESIA

Ir. Arko Djajadi, Ph.D.  
Swiss German University,  
INDONESIA

Prof. Dr. Ir. Suhono H Supangkat,  
M.Eng., CGEIT.  
School of Electrical Engineering  
and Informatics, Institut  
Teknologi Bandung, INDONESIA

Dr. Irhan Febijanto, M.Eng  
Research Center for  
Sustainable Production  
System and Life Cycle  
Assessment - BRIN, INDONESIA

Ir. Endra Joelianto, Ph.D.  
Engineering Physics, Institut  
Teknologi Bandung,  
INDONESIA

Prof. Dr. Ir. Zainal Abidin  
Mechanical and Aerospace  
Engineering, Institut Teknologi  
Bandung, INDONESIA

Dr. Narankhuu Jamsran  
Thomas Air LLC,  
MONGOLIA

Aji Prasetya Wibawa, Ph.D.  
Dept of Electrical Engineering,  
State University of Malang,  
INDONESIA

Prof. Dr. Ir. R. Danardono Agus  
Sumarsono, DEA., PE.  
Department of Mechanical  
Engineering, University of  
Indonesia, INDONESIA

Dr. Ir. Edi Leksono, M.Eng.  
Engineering Physics, Institut  
Teknologi Bandung,  
INDONESIA

Dr. Ir. Rizqon Fajar, M.Sc.  
Research Center for  
Transportation Technology - BRIN,  
INDONESIA

Prof. Sasongko Pramono Hadi  
Department of Electrical  
Engineering, Gadjah Mada  
University, INDONESIA

Ahmad Agus Setiawan, S.T.,  
M.Sc., Ph.D.  
Department of Engineering  
Physics, Faculty of Engineering,  
Gadjah Mada University,  
INDONESIA

Dr. Tushar Ahmed  
School of Aerospace, Mechanical  
and Mechatronic Engineering, The  
University of Sydney, AUSTRALIA

Prof. Juan Carlos Alvarez  
Dept. Electrical Engineering,  
University of Oviedo,  
SPAIN

Dr. Larissa Lorenz  
Bauhaus Luftfahrt e.V,  
GERMANY

Dr. Endra Pitowarno, M.Eng.  
Electronics Engineering,  
Polytechnic Institute of Surabaya  
(EEPIS), INDONESIA

Prof. Dr. Murat Lüy  
Department of Electrical and  
Electronic Engineering, Kırıkkale  
Universitesi, TURKEY

Dr. Si Steve Li  
Electromechanical System  
Development, General Electric  
Global Research Centre,  
UNITED STATES

Hendro Nurhadi, Dipl.Ing., Ph.D.  
Department of Mechanical  
Engineering - Institut Teknologi  
Sepuluh Nopember, INDONESIA

Prof. István Patkó  
Óbuda University,  
Budapest,  
HUNGARY

Anusua Ghosh  
School of Electrical and  
Information Engineering,  
University of South Australia,  
AUSTRALIA

Dr. Trina Fizzanty  
Research Center for Education -  
BRIN, INDONESIA

Anna Maria Sri Asih, S.T., M.M.,  
M.Sc., Ph.D.  
Mechanical & Industrial  
Engineering Department, Gadjah  
Mada University, INDONESIA

Dr.Eng. Anindito Purnowidodo,  
M.Eng.  
Mechanical Engineering Dept.,  
Brawijaya University,  
INDONESIA

Dr. Adha Imam Cahyadi  
Department of Electrical  
Engineering, Gadjah Mada  
University , INDONESIA

Dr. Wahyudi Sutopo, S.T., M.Si.  
Industrial Engineering,  
Universitas Sebelas Maret  
Surakarta, INDONESIA

Dr. Fendy Santoso  
Autonomous System Laboratory,  
School of Engineering and  
Information Technology, The  
University of New South Wales,  
AUSTRALIA

Dr. Dimas Anton Asfani, S.T., M.T.  
Department of Electrical  
Engineering - Institut Teknologi  
Sepuluh Nopember, INDONESIA

Dr. Ir. Feri Yusivar, M.Eng.  
Department of Electrical  
Engineering, University of  
Indonesia, INDONESIA

Dr. Agfianto Eko Putra, M.Sc.  
Department of Computer and  
Electronic Science, Gadjah Mada  
University, INDONESIA

Dr. Febliil Huda, S.T., M.T.  
Department of Mechanical  
Engineering, Universitas Riau,  
INDONESIA

Pudji Irasari, M.Sc.rer.nat.  
Research Center for Energy  
Conversion and Conservation -  
BRIN, INDONESIA

Dr. Sunit Hendrana  
Research Center for Physics - LIPI,  
INDONESIA

Dr. Eka Firmansyah  
Department of Electrical  
Engineering and Information  
Technology, Gadjah Mada  
University, INDONESIA

Dr. Arwindra Rizqiawan, S.T., M.T.  
School of Electrical Engineering  
and Informatics, Institut  
Teknologi Bandung, INDONESIA

Laksono Kurnianggoro, Ph.D.  
Department of Electrical  
Engineering, University of Ulsan,  
SOUTH KOREA

Yusie Rizal, Ph.D. Cand.  
Dept. Engineering Science,  
National Cheng Kung University,  
TAIWAN

Dr. Yuliadi Erdani  
Politeknik Manufaktur Bandung,  
INDONESIA

Dr. Joga Dharma Setiawan  
Faculty of Engineering,  
Diponegoro University,  
INDONESIA

Dr. Esa Prakasa, M.T.  
Research Center for Data  
and Information Sciences - BRIN,  
INDONESIA

Dr. Agus Purwadi, M.T.  
School of Electrical Engineering  
and Informatics, Institut  
Teknologi Bandung, INDONESIA

Slamet Riyadi, S. Ds., M.Ds., Ph.D.  
Product Design Department  
Faculty of Art and Design, Institut  
Teknologi Bandung, INDONESIA

## PUBLICATION ETHICS AND MALPRACTICE STATEMENT

Journal of Mechatronics, Electrical Power, and Vehicular Technology (hence MEV) is a journal aims to be a leading international peer-reviewed platform and an authoritative source of information. We publish original research papers, review articles and case studies focused on mechatronics, electrical power, and vehicular technology as well as related topics that has neither been published elsewhere in any language, nor is it under review for publication anywhere. This following statement clarifies ethical behavior of all parties involved in the act of publishing an article in this journal, including the author, the editor, the reviewer, and the publisher (National Research and Innovation Agency). This statement is based on COPE's Best Practice Guidelines for Journal Editors.

### DUTIES OF AUTHORS

1. **Reporting Standards:** Authors should present an accurate account of the original research performed as well as an objective discussion of its significance. Researchers should present their results honestly and without fabrication, falsification or inappropriate data manipulation. A manuscript should contain sufficient detail and references to permit others to replicate the work. Fraudulent or knowingly inaccurate statements constitute unethical behavior and are unacceptable. Manuscripts should follow the submission guidelines of the journal.
2. **Originality and Plagiarism:** Authors must ensure that they have written entirely original work. The manuscript should not be submitted concurrently to more than one publication unless the editors have agreed to co-publication. Relevant previous work and publications, both by other researchers and the authors' own, should be properly acknowledged and referenced. The primary literature should be cited where possible. Original wording taken directly from publications by other researchers should appear in quotation marks with the appropriate citations.
3. **Multiple, Redundant, or Concurrent Publications:** Author should not in general submit the same manuscript to more than one journal concurrently. It is also expected that the author will not publish redundant manuscripts or manuscripts describing same research in more than one journal. Submitting the same manuscript to more than one journal concurrently constitutes unethical publishing behavior and is unacceptable. Multiple publications arising from a single research project should be clearly identified as such and the primary publication should be referenced
4. **Acknowledgement of Sources:** Authors should acknowledge all sources of data used in the research and cite publications that have been influential in determining the nature of the reported work. Proper acknowledgment of the work of others must always be given.
5. **Authorship of the Paper:** The authorship of research publications should accurately reflect individuals' contributions to the work and its reporting. Authorship should be limited to those who have made a significant contribution to conception, design, execution or interpretation of the reported study. Others who have made significant contribution must be listed as co-authors. In cases where major contributors are listed as authors while those who made less substantial, or purely technical, contributions to the research or to the publication are listed in an acknowledgement section. Authors also ensure that all the authors have seen and agreed to the submitted version of the manuscript and their inclusion of names as co-authors.
6. **Disclosure and Conflicts of Interest:** All authors should clearly disclose in their manuscript any financial or other substantive conflict of interest that might be construed to influence the results or interpretation of their manuscript. All sources of financial support for the project should be disclosed.
7. **Fundamental Errors in Published Works:** If the author discovers a significant error or inaccuracy in the submitted manuscript, then the author should promptly notify the journal editor or publisher and cooperate with the editor to retract or correct the paper.
8. **Hazards and Human or Animal Subjects:** The author should clearly identify in the manuscript if the work involves chemicals, procedures or equipment that have any unusual hazards inherent in their use.

### DUTIES OF EDITOR

1. **Publication Decisions:** Based on the review report of the editorial board, the editor can accept, reject, or request modifications to the manuscript. The validation of the work in question and its importance to researchers and readers must always drive such decisions. The editors may be guided by the policies of the journal's editorial board and constrained by such legal requirements as shall then be in force regarding libel, copyright infringement and plagiarism. The editors may confer with other editors or reviewers in making this decision. Editors have to take responsibility for everything they publish and should have procedures and policies in place to ensure the quality of the material they publish and maintain the integrity of the published record.

2. **Review of Manuscripts:** Editor must ensure that each manuscript is initially evaluated by the editor for originality. The editor should organize and use peer review fairly and wisely. Editors should explain their peer review processes in the information for authors and also indicate which parts of the journal are peer reviewed. Editor should use appropriate peer reviewers for papers that are considered for publication by selecting people with sufficient expertise and avoiding those with conflicts of interest.
3. **Fair Play:** The editor must ensure that each manuscript received by the Journal is reviewed for its intellectual content without regard to sex, gender, race, religion, citizenship, etc. of the authors. An important part of the responsibility to make fair and unbiased decisions is the upholding of the principle of editorial independence and integrity. Editors are in a powerful position by making decisions on publications, which makes it very important that this process is as fair and unbiased as possible.
4. **Confidentiality:** The editor must ensure that information regarding manuscripts submitted by the authors is kept confidential. Editors should critically assess any potential breaches of data protection and patient confidentiality. This includes requiring properly informed consent for the actual research presented, consent for publication where applicable.
5. **Disclosure and Conflicts of Interest:** The editor of the Journal will not use unpublished materials disclosed in a submitted manuscript for his own research without written consent of the author. Editors should not be involved in decisions about papers in which they have a conflict of interest

#### DUTIES OF REVIEWERS

1. **Confidentiality:** Information regarding manuscripts submitted by authors should be kept confidential and be treated as privileged information. They must not be shown to or discussed with others except as authorized by the editor.
2. **Acknowledgement of Sources:** Manuscript reviewers must ensure that authors have acknowledged all sources of data used in the research. Reviewers should identify relevant published work that has not been cited by the authors. Any statement that an observation, derivation, or argument had been previously reported should be accompanied by the relevant citation. The reviewers should notify the journal immediately if they come across any irregularities, have concerns about ethical aspects of the work, are aware of substantial similarity between the manuscript and a concurrent submission to another journal or a published article, or suspect that misconduct may have occurred during either the research or the writing and submission of the manuscript; reviewers should, however, keep their concerns confidential and not personally investigate further unless the journal asks for further information or advice.
3. **Standards of Objectivity:** Review of submitted manuscripts must be done objectively and the reviewers should express their views clearly with supporting arguments. The reviewers should follow journals' instructions on the specific feedback that is required of them and, unless there are good reasons not to. The reviewers should be constructive in their reviews and provide feedback that will help the authors to improve their manuscript. The reviewer should make clear which suggested additional investigations are essential to support claims made in the manuscript under consideration and which will just strengthen or extend the work
4. **Disclosure and Conflict of Interest:** Privileged information or ideas obtained through peer review must be kept confidential and not used for personal advantage. Reviewers should not consider manuscripts in which they have conflicts of interest resulting from competitive, collaborative, or other relationships or connections with any of the authors, companies, or institutions connected to the papers. In the case of double-blind review, if they suspect the identity of the author(s) notify the journal if this knowledge raises any potential conflict of interest.
5. **Promptness:** The reviewers should respond in a reasonable time-frame. The reviewers only agree to review a manuscript if they are fairly confident, they can return a review within the proposed or mutually agreed time-frame, informing the journal promptly if they require an extension. In the event that a reviewer feels it is not possible for him/her to complete review of manuscript within stipulated time then this information must be communicated to the editor, so that the manuscript could be sent to another reviewer.

## CROSSMARK POLICY PAGE

All articles published in MEV receive a DOI and are permanently published. This applies regardless of the outcome of the peer review that follows after publication. All content, including articles that have not (yet) passed peer review, is permanently archived in Portico. All versions of all articles that have passed peer review will be archived in PubMed and elsewhere.

Authors can revise, change and update their articles by publishing new versions, which are added to the article's history; however, the individual versions, once published, cannot be altered or withdrawn and are permanently available on the MEV website. MEV participates in the [CrossMark](#) scheme, a multi-publisher initiative that has developed a standard way for readers to locate the current version of an article. By applying the CrossMark policies, MEV is committed to maintaining the content it publishes and to alerting readers to changes if and when they occur.

Clicking on the CrossMark logo (at the top of each MEV article) will give you the current status of an article and direct you to the latest published version; it may also give you additional information such as new referee reports. In order to maintain the integrity and completeness of the scholarly record, the following policies will be applied when published content needs to be corrected; these policies take into account current [best practice](#) in the scholarly publishing and library communities:

### CORRECTION TO AN ARTICLE

In traditional journals, where articles are peer reviewed before publication, Corrections (or Errata) are published to alert readers to errors in the article that became apparent following the publication of the final article. By contrast, articles in MEV undergo peer review post publication and publication is not 'final' as new versions can be added at any stage. Possible mistakes that come to light during the peer review process may be highlighted in the published referee reports, which are part of the article. Authors can publish revised versions, and any errors that become apparent during peer review or later can be corrected through the publication of new versions. Corrections and changes relative to the previous version are always summarized in the 'Amendments' section at the start of a new version.

### RETRACTION

Articles may be retracted for several reasons, including:

- honest errors reported by the authors (for example, errors due to the mixing up of samples or use of a scientific tool or equipment that is found subsequently to be faulty)
- research misconduct (data fabrication)
- duplicate or overlapping publication
- fraudulent use of data
- clear plagiarism
- unethical research

For any retracted article, the reason for retraction and who is instigating the retraction will be clearly stated in the Retraction notice. The retraction notice will be linked to the retracted article (which usually remains on the site) and the article will be clearly marked as retracted (including the PDF).

An article is usually only retracted at the authors' request or by the publisher in response to an institutional investigation. It is important to note in the context of MEV's publication model, that - as in traditional journals - a retracted article is not 'unpublished' or 'withdrawn' in order for it to be published elsewhere. The reasons for retraction are usually so serious that the whole study, or large parts of it, are not appropriate for inclusion in the scientific literature anywhere.

The content of a retracted article would only be removed where legal limitations have been placed upon the publisher, copyright holder or author(s), for example, if the article is clearly defamatory or infringes others' legal rights, or if the article is the subject of a court order. In such cases, the bibliographic information for the article will be retained on the site along with information regarding the circumstances that led to the removal of the content.

Under rare circumstances, for example, if false or inaccurate data have been published that, if acted upon, pose a serious health risk, the original incorrect version(s) may be removed and a corrected version published. The reason for this partial removal would be clearly stated on the latest version.

## PREPARING THE MANUSCRIPT

### FORMATTING REQUIREMENTS

Please use the author submission template available online at MEV Journal website. To use the template, kindly 'Save As' the MS Word file to your document, then copy and paste your document. To copy and paste the text into the template, please use 'Special Paste' and choose 'Unformatted Text'. Papers not prepared in accordance with author guidelines and manuscripts with number of mistakes will have to be pre-rejected by Editor.

Download the 'Author Submission Template' DOCX

[http://www.mev.lipi.go.id/mevfiles/MEV\\_author\\_submission\\_template\\_17.1.docx](http://www.mev.lipi.go.id/mevfiles/MEV_author_submission_template_17.1.docx)

If your article includes any Videos and/or other Supplementary material, this should be included in your supplementary file at initial submission for peer review purposes.

### Word Processing Software

The manuscript should contain at least 2.000 words and should not exceed 25 pages including embedded figures and tables, contain no appendix, and the file should be in Microsoft Office (.doc/.docx) or Open Office (.odt) format. The paper should be prepared in A4 paper (210 mm x 297 mm) using 25 mm for left margin and 2 mm for the top, bottom, and right margin. No need to alter page number in this template as the page number will be reordered at preprinting process. The whole manuscript body should be in one column, using font type Times New Roman (TNR), font size 12, first line indent 5 mm, and 1.5 line spacing.

Please make sure that you use as much as possible normal fonts in your documents. Special fonts, such as fonts used in the Far East (Japanese, Chinese, Korean, etc.) may cause problems during processing. To avoid unnecessary errors, you are strongly advised to use the 'spellchecker' function of MS Word.

### Section Headings

Divide your article into clearly defined and numbered sections. The abstract is not included in section numbering. Use this numbering also for internal cross-referencing: do not just refer to 'the text'. Any subsection may be given a brief heading. Each heading should appear on its own separate line.

Heading should be made in four levels. Level five cannot be accepted.

- *Heading Level 1*; Heading 1 should be written in title case, left aligned, bold, 14 TNR, and Roman numbered followed by a dot.
- *Heading Level 2*; Heading 2 should be written title case, left aligned, bold, 12 TNR, Capital Arabic numbered followed by a dot.
- *Heading Level 3*; Heading 3 should be written title case, left aligned, italic, 12 TNR, numbered by Arabic number followed by closed bracket
- *Heading level 4*; Heading 4 is not recommended, however, it could still be accepted with the format of sentence case, left indent 5 mm, hanging indent 5 mm, italic, 12 TNR, numbered by small cap followed by a closed bracket.
- *Heading Level 5*; Heading Level 5 cannot be accepted in the manuscript.

### ARTICLE STRUCTURE

The manuscript should begin with title, abstract, and keyword(s) followed by the main text. The main text should consist of at least IMRaD structure, except for the review article: Introduction, Method/Material, Result and Discussion, and Conclusion; followed by acknowledgement and References.

#### Introduction

State the objectives of the work and provide an adequate background, state of the art, and should be avoiding a detailed literature survey or a summary of the results. Explain how you addressed the problem and clearly state the aims of your study.

#### Material and methods

Provide sufficient details to allow the work to be reproduced by an independent researcher. Methods that are already published should be summarized and indicated by a reference. If quoting directly from a previously published method, use quotation marks and also cite the source. Any modifications to existing methods should also be described. A Theory section (if necessarily added) should extend, not repeat, the background to the article already dealt with in the Introduction and lays the foundation for further work. A Calculation section represents a practical development from a theoretical basis.

#### Results and discussion

Results should be clear and concise. Discussion should explore the significance of the results of the work, not repeat them. Avoid extensive citations and discussion of published literature. The following components should be covered in the discussion section: How do your results relate to the original question or objectives outlined in the Introduction section (what)? Do you provide interpretation scientifically for each of your results or findings

presented (why)? Are your results consistent with what other investigators have reported (what else)? Or are there any differences?

#### Conclusions

The main conclusions of the study may be presented in a short Conclusions section, which may stand alone or form a subsection of a Discussion or Results and Discussion section. The conclusion section should lead the reader to the important matter of the paper. Suggestion or recommendation related to further research can also be added but not to confuse the research with an uncompleted work.

#### Acknowledgements

Collate acknowledgements in a separate section at the end of the article before the references and do not, therefore, include them on the title page, as a footnote to the title or otherwise. List here those individuals who provided help during the research (e.g., providing language help, writing assistance or proof reading the article, etc.).

#### Appendices

It is not recommended to use appendices in MEV Journal submission.

### ESSENTIAL TITLE PAGE INFORMATION

#### Title

The title of the manuscript should be concise and informative, less than 15 words, title case, centered, bold. Titles are often used in information-retrieval systems. The title should be accurate, unambiguous, specific, and completely identify the main issue of the paper. Avoid abbreviations and formulae where possible.

#### Author names and affiliations

Author names should not contain academic title, official rank, or professional position. Please clearly indicate the given name(s) and last/family name(s) -full name if possible- of each author and check that all names are accurately spelled. Present the authors' affiliation addresses (where the actual work was done) below the names. Write clear affiliation of all Authors. Affiliation includes name of department/unit, (faculty), the name of university/institution, complete postal address, and country. All contributing author should be shown in contribution order.

#### Corresponding author

Clearly indicate the corresponding author clearly for handling all stages of pre-publication, refereeing, and post-publication. This responsibility includes answering any future queries about Methodology and Materials. Ensure that the e-mail address is given and that contact details are kept up to date by the corresponding author.

#### Present/permanent address

If an author has moved since the work described in the article was done, or was visiting at the time, a 'Present address' (or 'Permanent address') may be indicated as a footnote to that author's name. The address at which the author actually did the work must be retained as the main, affiliation address. Superscript Arabic numerals are used for such footnotes.

### ABSTRACT AND KEYWORDS

#### Abstract

Abstract should be concise and factual, contains neither pictures nor tables, and should not exceed 250 words. The abstract should state briefly the purpose of the research, research methods, the principal results, and major conclusions. An abstract is often presented separately from the article, so it must be able to stand alone. For this reason, References should be avoided, but if essential, then cite the author(s) and year(s). Also, non-standard or uncommon abbreviations should be avoided, but if essential they must be defined at their first mention in the abstract itself.

#### Graphical abstract

A graphical abstract is optional. Its use is encouraged as it draws more attention to the online article. The graphical abstract should summarize the contents of the article in a concise, pictorial form designed to capture the attention of a wide readership. Graphical abstracts should be submitted as a supplementary file in the online submission system. Image size: Please provide an image with a minimum of 531 × 1328 pixels (h × w) or proportionally more. The image should be readable at a size of 5 × 13 cm using a regular screen resolution of 96 dpi. Preferred file types: TIFF, EPS, PDF or MS Office files. You can view Example Graphical Abstracts on our information site.

#### Keywords

The keywords should be avoiding general and plural terms and multiple concepts. Be sparing with abbreviations: only abbreviations firmly established in the field may be eligible. These keywords will be used for indexing purposes.

## INSTRUMENTS

### Abbreviations, Acronyms, and Units

Define abbreviations and acronyms at the first time they are used in the text, even after they have been defined in the abstract. Abbreviations such as IEEE, SI, MKS, CGS, sc, dc, and rms do not have to be defined. Do not use abbreviations in the title or heads unless they are unavoidable. Use either SI (MKS) or CGS as primary units. (SI units are encouraged.) English units may be used as secondary units (in parentheses). An exception would be the use of English units as identifiers in trade, such as "3.5-inch disk drive." Avoid combining SI and CGS units, such as current in amperes and magnetic field in oersteds. This often leads to confusion because equations do not balance dimensionally. If you must use mixed units, clearly state the units for each quantity that you use in an equation.

Do not mix complete spellings and abbreviations of units: "Wb/m<sup>2</sup>" or "webers per square meter," not "webers/m<sup>2</sup>." Spell units when they appear in text: "...a few henries," not "...a few H." Use a zero before decimal points: "0.25," not ".25." Use "cm<sup>3</sup>," not "cc".

### Math formulae

Mathematical equation should be clearly written, numbered orderly, and should be an editable text prepared using MS Equation Editor (not in image format) and should also be separated from the surrounding text. Be sure that the symbols in your equation have been defined before or immediately following the equation. Use "(1)," not "Eq. (1)" or "equation (1)," except at the beginning of a sentence: "Equation (1) is ...". Italicize Roman symbols for quantities and variables, but not Greek symbols. Use a long dash rather than a hyphen for a minus sign.

### Header-footer and hyperlink

Header and footer including page number must not be used. All hypertext links and section bookmarks will be removed from papers. If you need to refer to an Internet email address or URL in your paper, you must type out the address or URL fully in Regular font.

### Footnotes

Footnotes should be avoided if possible. Necessary footnotes should be denoted in the text by consecutive superscript letters. The footnotes should be typed at the foot of the page in which they are mentioned, and separated from the main text by a short line extending at the foot of the column.

## FIGURE AND TABLE

Figure should be in grayscale, and if it made in color, it should be readable (if it later printed in grayscale). A caption should be sequentially numbered with Arabic numerals and comprise a brief title (not on the figure itself) and a description of the illustration. Keep text in the illustrations themselves to a minimum but explain all symbols and abbreviations used. The lettering on the artwork should be clearly readable and in a proportional measure and should have a finished, printed size of 8 pt for normal text and no smaller than 6 pt for subscript and superscript characters. Use words rather than symbols or abbreviations when writing Figure axis labels to avoid confusing the reader. As an example, write the quantity "Magnetization," or "Magnetization, M," not just "M." If including units in the label, present them within parentheses. Do not label axes only with units. In the example, write "Magnetization (A/m)" or "Magnetization (A ( m(1)," not just "A/m." Do not label axes with a ratio of quantities and units. For example, write "Temperature (K)," not "Temperature/K."

Figures should have a brief description in the main body of the manuscript. Insert figures and tables after they are cited in the text. For layouting purpose, please provide high resolution figure ( $\geq 300$ dpi) in .tif/.jpg/.jpeg. Low-quality scans are not acceptable. Figures and tables should be embedded and not supplied separately. Moreover, kindly avoid mentioning the position of figure/table e.g. "figure below" or "table as follow" because the position will be rearranged in layouting process. DO NOT put boxes around your figures to enclose them.

We suggest that you use a text box to insert a graphic (which is ideally at least 300 dpi resolution TIFF or EPS file with all fonts embedded) because this method is somewhat more stable than directly inserting a picture. To have non-visible rules on your frame, use the MSWord "Format" pull-down menu, select Text Box > Colors and Lines to choose No Fill and No Line.

### Electronic artwork

#### General points:

- Make sure you use uniform lettering and sizing of your original artwork.
- Preferred fonts: Arial (or Helvetica), Times New Roman (or Times), Symbol, Courier.
- Number the illustrations according to their sequence in the text.
- Use a logical naming convention for your artwork files.

### Formats

Regardless of the application used, when your electronic artwork is finalized, please 'save as' or convert the images to one of the following formats (note the resolution requirements for line drawings, halftones, and line/halftone combinations given below):

- EPS (or PDF): Vector drawings. Embed the font or save the text as 'graphics'.

- TIFF (or JPG): Color or grayscale photographs (halftones): always use a minimum of 300 dpi.
- TIFF (or JPG): Bitmapped line drawings: use a minimum of 1000 dpi.
- TIFF (or JPG): Combinations bitmapped line/half-tone (color or grayscale): a minimum of 500 dpi is required.

Please do not:

- Supply files that are optimized for screen use (e.g., GIF, BMP, PICT, WPG); the resolution is too low.
- Supply files that are too low in resolution.
- Submit graphics that are disproportionately large for the content.

Figure captions

Ensure that each illustration has a caption. A caption should comprise a brief title (not on the figure itself) and a description of the illustration. Keep text in the illustrations themselves to a minimum but explain all symbols and abbreviations used. figure caption of a single line must be centered whereas multi-line captions must be justified

Tables

Please submit tables as editable text and not as images. Number tables consecutively with Arabic numerals in accordance with their appearance in the text. Place footnotes below the table body and indicate them with superscript lowercase letters. Be sparing in the use of tables and ensure that the data presented in them do not duplicate results described elsewhere in the article. Please avoid using vertical rules and shading in table cells.

## CONSTRUCTION OF REFERENCES

References are recommended using IEEE referencing style. Please ensure that every reference cited in the text is also present in the reference list (and vice versa). References should be listed at the end of the paper and numbered in the order of their appearance in the text. The template will number citations consecutively within brackets [1]. The sentence punctuation follows the bracket [2]. Refer simply to the reference number, as in [3]–do not use “Ref. [3]” or “reference [3]” except at the beginning of a sentence: “Reference [3] was the first ...”

Unpublished results and personal communications are not recommended in the reference list but may be mentioned in the text. If these references are included in the reference list, they should follow the standard reference style of the journal and should include a substitution of the publication date with either 'Unpublished results' or 'Personal communication'. Citation of a reference as 'in press' implies that the item has been accepted for publication. Wikipedia, personal blog, or non-scientific website is not allowed to be taken into account. Primary references should be at least 80% from at least fifteen references. References should be taken from the late ten years.

Avoid bulk references such as [1–9]. Avoid excessive self-citations (no more than 20%). If possible, article's DOI should be given for each reference list.

Reference formatting

There are two types of references, i.e., electronics sources and nonelectronics sources. Sample of correct formats for various types of references are as follows

- *Book*: Author, *Title*. edition, editor, City, State or Country: Publisher, year, Pages.
- *Part of book*: Author, “Title”, in *Book*, edition, editor, City, State or Country: Publisher, year, Pages.
- *Periodical*: Author, “Title”, *Journal*, *volume (issue)*, pages, month, year.
- *Proceeding*: Author, “Title”, in *Proceeding*, year, pages.
- *Unpublished paper*: Author, “Title”, presented at Conference/ event title, City, State or Country, year.
- *Patent/Standart*: Author, “Title”, patent number, month day, year.
- *Technical report*: Author, “Title”, Company, City, State or Country, Tech. Rep. Number, month, year.

Three pieces of information are required to complete each reference from electronics sources: 1) protocol or service; 2) location where the item is to be found; and 3) item to be retrieved. Sample of correct formats for electronics source references are as follows:

- *Book*: Author. (year, month day). *Title*. (edition) [Type of medium]. *volume (issue)*. Available: site/path/file.
- *Periodical*: Author. (year, month). *Title*. *Journal*. [Type of medium]. *volume (issue)*, pages. Available: site/path/file.
- *Papers presented at conferences*: Author. (year, month). *Title*. Presented at Conference title. [Type of Medium]. Available: site/path/file.
- *Reports and handbooks*: Author. (year, month). *Title*. Company. City, State or Country. [Type of Medium]. Available: site/path/file.

Reference management software

Every article submitted to MEV Journal shall use reference management software that supports Citation Style Language styles, such as Mendeley and Zotero, as well as EndNote®.
